1. Evidence that the viticultural area is known by the proposed name

The Yucaipa Valley consists of the incorporated towns of Yucaipa, Calimesa, unincorporated areas of Oak Glen, as well as surrounding county areas comprised of natural borders.

This geographic region can be recognized as far back as the late 1700's, and early 1800's. Yucaipa is thought to have meant "wetlands" owing to its well endowed water sources from the San Bernardino Mountains. Within the current Yucaipa Hazard Mitigation Plan, settling of the Yucaipa Valley is explicitly stated, beginning shortly after California statehood in 1850 and accelerating over the following decades. (Exhibit 1)

As early as the 1920's, as referenced by the Pacific Rural Press, the Yucaipa Valley gained regional and national renown for its fertile soils and farmland. (Exhibit 2) Yucaipa Valley continued to gain acclaim for the quality of its produce over the coming decades. Yucaipa Apple Festivals received recognition from then California Governor Hiram Johnson and then President William Taft, both of whom praised, in writing, "Yucaipa Valley apples." (Exhibit 3)

The Yucaipa Valley continued to be referenced as premier farming territory and agricultural land by the city itself throughout the 1950's, as evidenced by the photo below. Before the town of Yucaipa was incorporated, the area continued to be referred to as Yucaipa Valley. The picture in **Exhibit 4** is a prime example.

Though the town of Yucaipa was eventually incorporated in 1989, the name Yucaipa Valley has persisted throughout the modern era, manifesting itself in the following forms:

The "Yucaipa Valley Historical Society" continues to preserve the heritage of Yucaipa, Oak Glen, Calimesa. (Exhibit 5)

+Yucaipa's premier golf course is called the "Yucaipa Valley" Golf Club. (Exhibit 6)

+Yucaipa's special water district that serves many of the surrounding communities is called the Yucaipa Valley Special Water District. The special district offers one of the most well delineated lines for the proposed viticultural boundary as evidenced by the photo in **Exhibit 7**. The areas served by the Yucaipa Valley Water District (YVWD) are an approximate representation of the Yucaipa Valley, and included in our proposed AVA Boundary which ads additional county land delineated by natural boundaries. We've marked the location of the Yucaipa Valley Water District on **Exhibit 8**, and for reference the address of the YVWD is 880 W County Line Ln, Calimesa, CA 92320.

+Beaver Medical Center, a medical group based in the Inland Empire, refers to their Yucaipa location as the "Yucaipa Valley Office." (Exhibit 9)

+The "Yucaipa Valley Real Estate" Group is a property management and real estate office located in the Yucaipa Valley. (Exhibit 10)

+Both baseball little leagues in Yucaipa include the name Yucaipa Valley: The Yucaipa Valley National League (Exhibit 11) and the Yucaipa Valley American League (Exhibit 12).

+The USGS specifically refers to "Yucaipa Valley Hydrology" on their website and includes several images detailing the valley throughout their discussion of Yucaipa Valley Water Management (Exhibit 13).

+Yucaipa's newly renovated shopping center is referred to as the "Yucaipa Valley Center." (Exhibit 14)

+The Chapter of the Lions Club that exists in our region is called the "Yucaipa Valley Lions Club." (Exhibit 15)

+A Spanish Church located in our region is called the "Yucaipa Valley Spanish Church." (Exhibit 16)

+An amateur radio club in the Yucaipa Valley goes by the name of the "Yucaipa Valley Amateur Radio Club." (Exhibit 17)

+An eye doctor on Yucaipa Boulevard is called "Yucaipa Valley Optometry." (Exhibit 18)

+The name of Yucaipa's Youth Soccer Program is called the "Yucaipa Valley Youth Soccer Organization." (Exhibit 19)

+The name of the manufactured home community in our region is called the "Yucaipa Valley Manufactured Home Community." (Exhibit 20)

+The name of the conservancy charged with protecting lands in our region is called the "Yucaipa Valley Conservancy." (Exhibit 21)

In conclusion, the stated evidence proves beyond a reasonable doubt that the Yucaipa Valley, and the proposed viticultural area has been recognized locally, statewide, and even nationally for it's farmland and produce over the span of the last 150 years, and that the name continues to be widely appropriated by businesses and organizations alike in present day use.

2. Historical evidence that the proposed boundaries of the viticultural area are correct

A. Historical Evidence

The Yucaipa Valley has a rich history of cultivation, ranging from peaches, plums, walnuts, and most notably apples. It was one of the fruit baskets of Southern California for the first half of the 20th century, and known to have a near perfect agricultural climate.

The planting of grain on the lower benches and fruit, mainly apples and cherries, higher up on the North Bench and Oak Glen, happened during the early settlement days of the valley.

Grape cultivation in the Yucaipa Valley can be traced as far back as the late 19th century, and early 20th century.

Several prominent ranches in Yucaipa, including the well known Casa Blanca Ranch, then called the Dunlap Ranch after the famous Yucaipa settler John Dunlap, had vineyards adjacent to their farmlands (Exhibit 22) as early as the late 19th century.

Home-seeking ads in 1910 continued to champion the soils of Yucaipa, stating that "grapes, apricots, and olives are big producers" in the region. (Exhibit 23)

Horticultural Jottings in the 1922 Pacific Rural Press recorded the Carter Brothers, Yucaipa fruitland owners, seeding 25 acres of grapes in the Yucaipa Valley (Exhibit 24), and the cultivation of modest vineyards throughout the Yucaipa Valley continued up through the 1960's as a referenced in land for sale ads in 1966 publications (Exhibit 25).

The cultivation of grapes in the Yucaipa Valley continued on a small scale up through the present day, until a growing movement of viticulturalists began vinifying the valley over the past decade at a rapid rate.

B. Current Evidence

Grape cultivation in the Yucaipa Valley has accelerated over the last decade thanks to the water efficiency of viticulture in a drought climate and a growing movement for vinification within the Yucaipa Valley.

The Yucaipa Valley has 23 known vineyards, with several under construction as growers aim to create micro-boutique wineries within the proposed AVA. These vineyards are mapped out on our USGS maps as well as **Exhibit 26**, and are geographically spread throughout the proposed AVA boundaries. We've also included vineyards that currently being consulted, and built in a separate color designated consultations on the map's legend.

Vineyards in the Yucaipa Valley range from 20 plantings up to 1,980 plantings, the largest of which are located in Yucaipa's North Bench region. The largest concentration of vineyards in the Yucaipa Valley exists within the East End, at an elevation ranging from 3,000 to 3,400 ft. At least 11 vineyards have been identified in the East End with more plantings anticipated. The total acreage of the vineyards planted in the East End is around 2.6 acres under vine.

A complete list of varietals that have been planted can be found at **Appendix 2**, which include many varieties suited for a hot, dry climate including but not limited to: Cabernet Sauvignon, Merlot, Zinfandel, Syrah, Malbec, Nebbiolo, Barbera, and Petite Sirah.

The Yucaipa Valley itself has two currently licensed and fully bonded wineries in the region: Wildwood Oak Winery, founded by Anita Matlock, (Exhibit 27) and Suveg Cellars, Yucaipa's first officially recognized bonded winery established in 2010 and founded by Craig Suveg. (Exhibit 28) Several viticulturists within the Yucaipa Valley plan to submit or intend to pursue licensing and bonding as their vines reach maturity.

The use of Yucaipa grapes, to their maximum permissible quantity, has already yielded international recognition for quality. Using under 15% Yucaipa grown Cabernet Sauvignon by volume and the remainder Lodi Cabernet Sauvignon, Suveg Cellars wine "Incorrigible" received a silver medal at the Los Angeles

International Wine Competition in 2017, the first instance of Yucaipa Valley cultivated grape, in part, receiving international acclaim. Craig Suveg continues to harvest and incorporate his fruit into his wines. (Exhibit 29)

Suveg Cellars has gone on to win over 45 international medals for its wine as of this petition (Exhibit 30), and Wildwood Oak Winery just took home its first medals in international competition (Exhibit 31). Both wineries are attracting international attention to the Yucaipa Valley for their application of unique winemaking techniques and artisan quality wine production.

3. Geographical features that produce growing conditions which distinguish the proposed area from surrounding regions

The rolling foothills of the San Bernardino Mountains, canyons, and microclimates within the Yucaipa Valley create a unique viticultural region that is distinguishable in several ways from surrounding areas.

Higher elevation vineyards located within the proposed boundaries offer several critical contrasts to our counterparts in surrounding AVA's. A combination of more direct and concentrated sunlight, dramatic temperature shifts, as well as soils & drainage create a microclimate in the Yucaipa Valley that is near incomparable to any other AVA in California.

The historical definition of the Yucaipa Valley, as defined by the Yucaipa Valley Historical Society, creates an imperative distinction that is used to define our boundaries throughout this petition and section. According to the YVHS, "The Yucaipa Valley Historical Society is a non-profit organization dedicated to the preservation of the artifacts, photographs and stories that make up the history of Yucaipa, Oak Glen, and Calimesa." The boundaries of the Yucaipa Valley are clearly delineated by the Historical Society to mean the boundaries of Yucaipa, Oak Glen, and Calimesa. This geo-historical definition thus excludes areas surrounding the Yucaipa Valley that may have similar elevation, temperature shifts, and soil, as detailed in this section.

A. Elevation and features

The elevation in the Yucaipa Valley ranges from 2000-4600 ft above sea level encompassing Oak Glen to the Yucaipa Basin, creating a unique, higher altitude viticultural area compared to many of the surrounding areas in Southern California.

The North Bench and East End, two recognizable sub-regions within the AVA boundaries, are located around 3000 ft and range up to 3600 ft, while Oak Glen, an area within the boundaries of the

proposed AVA, ranges in elevation from around 4000 ft to 4600 ft. The elevation of the Yucaipa Valley is a defining characteristic of the proposed AVA boundaries.

To the immediate north and northeast of the proposed AVA boundary is the Yucaipa Ridge Mountain Range, walling off the northern and northwest boundary of the AVA with steep slopes that generate elevations up to 2000 ft higher than the proposed Northern AVA boundaries at each point.

To the west of the Proposed AVA is the Redlands Valley, which gradually descends from 2000ft at the western edge of the proposed AVA all the way to 1100 ft at the Western boundary of Redlands City.

To the southwest and south southwest is the San Timoteo Canyon, and area between 1600-2000 ft with it's own distinct microclimate. Though having similar features to the rolling hills of the Yucaipa Valley, the area has a lower elevation than the proposed AVA Boundaries of the Yucaipa Valley, maintaining historic ties to Redlands.

Areas that lead up to the Yucaipa Valley, including Mill Creek Basin to the Northwest and Cherry Valley and Beaumont to the south and southeast have similar elevations to the lower portions of the proposed AVA, but are not located within the historic Yucaipa Valley boundaries. Mill Creek is part of the community of Mentone that is largely included in the history of neighboring Redlands, and Beaumont and Cherry Valley have do not have historic ties to the Yucaipa Valley. Additionally Mill Creek is mostly comprised of dry creek bed, and the Beaumont/Cherry Valley area does hot have the same rolling hills and features as the Yucaipa Valley.

Land directly to the east of the proposed AVA boundaries does have comparable elevation to the upper regions of the AVA, but is largely uninhabited, undeveloped, and unreachable mountainous terrain that maintains no historic ties to the Yucaipa Valley. Therefore, this land was excluded from the proposed AVA.

All of California's highest altitude vineyards located within an established AVA, such as Shadow Mountain Vineyards at 3500 ft. (Exhibit 32), Santa Barbara Highlands at 2,800 - 3200 ft (Exhibit

33), and several other vineyards around the 2700 ft mark would fall within the elevation ranges proposed within the Yucaipa Valley AVA, and be about 1000-1500 ft shy of the highest altitude points within our proposed boundaries. Once passed, the Yucaipa Valley AVA will likely encompass the highest altitude vineyards within an AVA designation in California.

Relative to the surrounding regions, Yucaipa Valley's elevation creates a unique set of conditions for the cultivation of grapes. Because of the higher elevations in the Yucaipa Valley microclimate, the grape growing season is longer and much of the harvest takes place in October. As sunlight becomes more concentrated at these higher elevations, grapes receive a "tan", resulting in a thicker grape skin which contributes to color and tannin, both essential for high quality, age worthy wine. These thicker grape skins protect the grapes from dramatic climate shifts that affect high altitude vineyard, which are discussed in further detail in the coming section.

Grapes are grown on primarily south and southwest facing slopes in the Yucaipa Valley, especially in the North Bench an East End region that has a natural, slow south-westerly slope, and in Oak Glen where some areas westerly facing and other a southern facing. South and southwest facing slopes are important to provide grapes extended sun exposure during the growing season, encouraging enhanced ripening thanks to more direct light.

B. Temperature and Diurnal Variation

From 2000 ft to 4600 ft, a unique set of growing conditions within our proposed boundaries emerge. Temperatures within the proposed AVA can see large daytime to nighttime fluctuations, marking the proposed AVA with a significant temperature variability not found in other growing regions.

Using average monthly high and low climate data aggregated over many years by weather.com, the Yucaipa Valley has an average diurnal shift of 29.1 degrees during the months of the growing season (Exhibit 34). In other words, the average difference between the high and low temperatures on any given day in the growing season is almost 30 degrees, a significant diurnal shift during the growing season within the proposed AVA. Areas to to

the west outside the proposed AVA, like Redlands, and southwest at lower elevations have only a 27.1 degree average diurnal shift during growing season (Exhibit 35). Areas to the north and north east, like Forest Falls, which have much higher, mountainous elevations have an average diurnal shift of only 20.85 degrees during the growing season (Exhibit 36). Beaumont and Cherry Valley to the south of the proposed boundary have the same wild diurnal shifts as the Yucaipa Valley, an average of 29.1 (Exhibit 37). However each is outside the historic Yucaipa Valley boundaries, as is the uninhabited undeveloped hillsides and smaller mountains to the east of the proposed AVA, so these regions are thereby excluded from the proposed AVA. All the data listed above is aggregated in the spreadsheet in (Exhibit 38).

The large diurnal shifts during the growing season lead to an optimal and even ripening of grapes. Diurnal shifts also encourage a balance between sugar and acidity, creating higher quality clusters to be used in the winemaking process.

C. Climate and Precipitation

Though there is temperature variation within the Yucaipa Valley, there is remarkably little variation within moisture and precipitation within the region. The Yucaipa Valley is a dry, arid, mediterranean climate with average cumulative rainfall from April-October of just over 4 inches. (Exhibit 34) However, snow accumulations accrue at higher elevations during winter months when vines are dormant (Exhibit 39), making the proposed Yucaipa Valley AVA one of the only wine growing regions in the state to receive snowfall in the winter months. This combination of a mediterranean arid climate and a mountain microclimate given its elevation is another attribute of the Yucaipa Valley that is irreplicable for an AVA designation.

Compared to each of the region's surrounding it, the Yucaipa Valley is the only region to have snow in the winter. Redlands to the west does not have the low temperatures or elevation for snow in the winter months, nor does the San Timoteo Canyon to the southwest. Beaumont and Cherry Valley to the south and southwest of the AVA boundaries have similar elevation to the Yucaipa Valley's lower boundaries, but does no have the upper elevation

of the proposed AVA to receive snowfall in the winter time. The Yucaipa Ridge to the north and northeast of the proposed AVA has a mountainous climate with a high elevation that generally does not move into the 90's during the summer. And though the Mill Creek Basin to the northwest and smaller mountains east of the Yucaipa Valley have similar climates, they are both outside the historic Yucaipa Valley, and as mentioned previously the mountains to the east are unreachable and undeveloped.

Snow within a vineyard during dormant months has several beneficial effects on vines. First snow creates hydric reserves that are beneficial during hot, dry summer months. Also, snow protects vines against fungi and pests that hide inside their bark at colder temperatures. Lastly, snow helps encourage much needed vegetative stop for vines, a necessary rest during winter months from continual growth. (Exhibit 40)

D. Soils and Drainage

Soil in the Yucaipa Valley has been classified as favorable to grape growing based on soil studies conducted by licensed and certified laboratories. (Exhibit 41). Thanks to the gradual slopes within the Yucaipa Valley and proximity to the mountain range, the terroir created by the mountainous terrain is optimal for drainage. Soil drainage is designated as well drained to at points excessively drained. The soil in the Yucaipa Valley is generally classified as Sandy Loam in texture by the U.S.D.A with a favorable neutral pH rating; a type of soil that lends breathability to grapevines.

Drainage and breathability in soil is very important to viticulture. Vine roots need air to function, and soil lacking drainage can become waterlogged, slowly killing the roots of the vine. Waterlogging has also been tied to increased risk for disease, and decreases in soil nutrition and yields, underscoring the importance of the well drained soil in the Yucaipa Valley. (Exhibit 42)

Nitrogen in Yucaipa soil has been rated optimal in the testing we have completed, as well as optimal magnesium and calcium. Each plays their important part in the farming of quality grapes. Excess nitrogen in soil can lead to the vines prioritizing shoot

growth instead of grape maturation, and lack of nitrogen can prevent photosynthesis, and vine growth altogether (Exhibit 43). Lack of magnesium can create leaf yellowing of the vine leaves affecting the health of the canopy (Exhibit 44), and calcium deficiency makes the soil less likely to properly retain water in dry months (Exhibit 45).

The Yucaipa Valley is different from the areas to the south west and south west-west, and area commonly known as the Badlands, made up of depressions and not alluvial fans suitable for agriculture. Also to the north and the northeast of the Yucaipa Valley, the Yucaipa Ridge is made up of bedrock with a completely different soil composition. That being said, areas to the west of the Yucaipa Valley, Northwest, South, Southeast, and East have similar soil made from many alluvial fans and slopes. However, these regions were not included in the proposed AVA because they are not within what has been historically defined as the Yucaipa Valley, and we are currently not aware of any examples of commercial viticulture in these areas. All information in the section comes from the UC Davis Soils Maps in Exhibit 46.

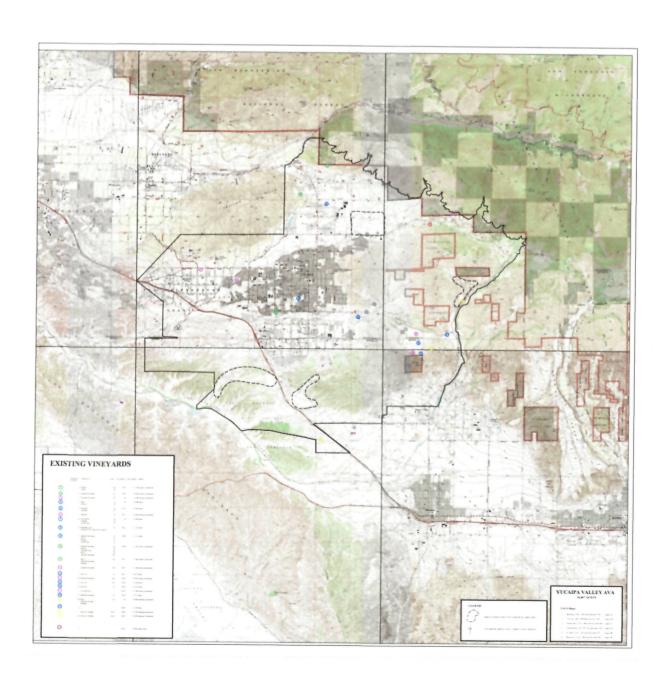

4. Narrative description of the boundaries based on features in the USGS

- 1. The boundary begins on Map B at the intersection of Highway 38/Mill Creek Road and the western boundary of section 13. From the beginning point, the boundary proceeds northeast along Highway 38/Mill Creek Road to the 2,924-foot benchmark in section 13; then
- 2. Proceed east in a straight line to the 3,800-foot elevation contour in section 18; then
- 3. Proceed east-southeasterly along the 3,800-foot elevation contour, crossing from Map B to Map C, to its intersection with Wilson Creek along the eastern boundary of section 21; then
- 4. Proceed northerly along Wilson Creek to the 4,400-foot elevation contour in section 22; then
- 5. Proceed south-southeasterly along the 4,400-foot elevation contour to its intersection with Birch Creek in section 26; then
- 6. Proceed northeasterly along Birch Creek to the 5,200-foot elevation contour in section 26; then
- 7. Proceed south-southeasterly along the 5,200-foot elevation contour to its intersection with Wallace Creek along the San Bernardino National Forest boundary in section 31; then
- 8. Proceed southwesterly along Wallace Creek to its confluence with Little Gorgonio Creek near the gaging station in section 1; then
- 9. Proceed southwesterly along Little Gorgonio Creek, crossing from Map C into Map F, to its intersection with Orchard Avenue in section 22; then

- 10. Proceed west along Orchard Street to the point where the road makes a sharp turn south and becomes locally known as Taylor Street along the western boundary of section 28; then
- 11. Proceed south along Taylor Street to its intersection with Vineland Avenue in section 28; then
- 12. Proceed west along Vineland Avenue to its intersection with an unnamed road known locally as Union Street, at the Border of Map F and E, in section 29; then
- 13. Proceed south along Union Street to its intersection with Cherry Valley Boulevard in section 29; then
- 14. Proceed west, into Map E, along Cherry Valley Boulevard to its intersection with Interstate 10 in the Tract Between San Jacinto and San Gorgonio; then
- 15. Proceed southeasterly along Interstate 10 to its intersection with the first unnamed intermittent stream in section 32; then
- 16. Proceed west in a straight line to the western boundary of section 31; then
- 17. Proceed north along the western boundary of section 31 to the southernmost transmission line at northwestern corner of section 31; then
- 18. Proceed northwesterly along the transmission line to its intersection with San Timoteo Parkway; then
- 19. Proceed northwesterly along San Timoteo Parkway to its intersection with the western boundary of the Tract Between San Jacinto and San Gorgonio; then
- 20. Proceed north, then northeasterly along the boundary of the tract to its intersection with the southwestern corner of section 22; then

- 21. Proceed north along the western boundary of section 22 to the southeastern corner of section 16; then
- 22. Proceed west along the southern boundaries of sections 16 and 17 to the southwestern corner of section 17; then
- 23. Proceed north along the western boundary of section 17 to the Riverside-San Bernardino County Line, crossing from Map F to Map B; then
- 24. Proceed east along the Riverside-San Bernardino County Line to the eastern boundary of section 17; then
- 25. Proceed north in a straight line to the boundary of the San Bernardino Land Grant; then
- 26. Proceed west along the land grant boundary to its intersection with the eastern boundary of section 8; then
- 27. Proceed north along the eastern boundary of sections 8 and 5 to the intersection of the northeastern corner of section 5 and an unnamed road known locally as Highview Drive; then
- 28. Proceed northwest in a straight line to the intersection of Interstate 10 and the eastern boundary of section 6; then
- 29. Proceed northeast in a straight line to the northeast corner of section 32; then
- 30. Proceed east along the northern boundaries of sections 33, 34, and 35 to the southwestern corner of section 25; then
- 31. Proceed north along the western boundary of sections 25, 24, and 13, to the intersection of Mill Creek Road; then
- 32. Proceed Northeast on Mill Creek Corad returning to the beginning point.

Fact sheet California's Yucaipa Valley Viticulture Region

- 1. Located 70 miles east of Los Angeles along the I-10 Freeway
- 2. Settled and named in the early 1850's
- 3. Has been nationally recognized for agricultural contributions for almost 100 years
- 4. First bonded winery in region, Suveg Cellars, has received numerous international distinctions for the quality of its wine using locally grown Yucaipa grapes..
- 5. known vineyards in the proposed viticultural region.
- 6. Vineyards range from 20-2,000 plantings
- 7. The Yucaipa Valley AVA will be one of the highest elevation AVA's in California if approved.
- 8. Grapes with the proposed region can reach between 24-26 brix at peak ripening.

Agriculture Takes Root

Fed by downstream wash from the mountains, Yucaipa's fertile valley and climate were well suited for agriculture, its first industry. During the 1800s, the Yucaipa Valley was used as grazing land for a satellite property of San Gabriel Mission's Rancho San Bennardino. For the next 100 years, the Yucaipa Valley became known for its agriculture and ranching enterprises. Yucaipa lands were transferred from the missions to Antonio Maria Lugo in 1842, and later to Diego Sepulveda. Sepulveda built the Rancho Yucaipa, which stands today as California Historical Landmark 528. Vestiges of this ranching history are still visible around the area.

Early California Settlements

Shortly following California statehood in 1850, settlers began to migrate to the Yucaipa Valley. John Dunlap settled on the Sepulveda Ranch, which became known as "Dunlap Acres." In 1869, Dunlap expanded agricultural operations to include grain. The Dunlaps also built Casa Blanca in 1882 and the first school on Cherrycroft Drive, now restored under private ownership. Ranches were also established in Wildwood Canyon, the North Bench area, and Live Oak Canyon. The only other early industry in the Yucaipa Valley to generate as much excitement was gold mining, which had a short-lived success due to mining in the Crafton Hills.

Casa Blanca was the home of John Dunlap, 1

"Where the Big Red Apple Grows"

U-KI-PA (Yucaipa) brand apples, patent l

The early 1900s saw changes in Yucaipa Valley's agriculture, from large-scale ranching to apple orchards. From 1900 to 1910, the Redlands-Yucaipa Land Company bought 11,000 acres in Yucaipa, and soon thereafter, developers began to sell ranches to make way for a burgeoning apple industry. For several decades, apple production became a staple for the local economy, and the goal was to create the "apple kingdom" of the Southwest. As people migrated to Yucaipa in search of wealth, a town center began to form at the corner of Yucaipa Boulevard and California Street.

The Yucaipa Valley Historical Society is a nonprofit organization dedicated to the preservation of the artifacts, photographs and stories that make up the history of Yucaipa, Oak Glen, and Calimesa.

The Society, made up of volunteers, has developed and oversees two museums, the Mousley Museum of Yucaipa History and the Old Fire Station Museum.

The Mousley Museum serves as the headquarters for the Yucaipa Mousley Museum of Valley Historical Society and contains exhibits of artifacts from the time of early Native
Americans inhabitants up to the
time when Yacaipa incorporated
in 1989. In addition to the
exhibits, the museum serves as a research center and a historical resource for the community. If also offers educational services through its program series and special enrichment activities for all ages. Admission is free.

BE A PART OF YVNLL HISTORY

Yucaipa Valley National Little League invites you to be part of a special commemorative opportunity. Help us keep YVNLL a vibrant and strong part of the Yucaipa community by purchasing an engraved brick for our pathway to the 13th Street Sports Complex. All proceeds from this effort will be used to complete important capital improvements at our fields.

This unique opportunity will allow you to memorialize your family's place in Yucaipa Valley National Little League's history and create a lasting presence that will impact generations to come. These custom tiles will be prominently placed on the main pathway to our fields. Purchase a brick (or more) for your family, your children, a favorite coach, in memory of a loved one, for your business or client and become permanently associated with Yucaipa Valley National Little League. Each sponsored brick will be visible to all those that walk along the pathway.

Be a part of YVNLL history!

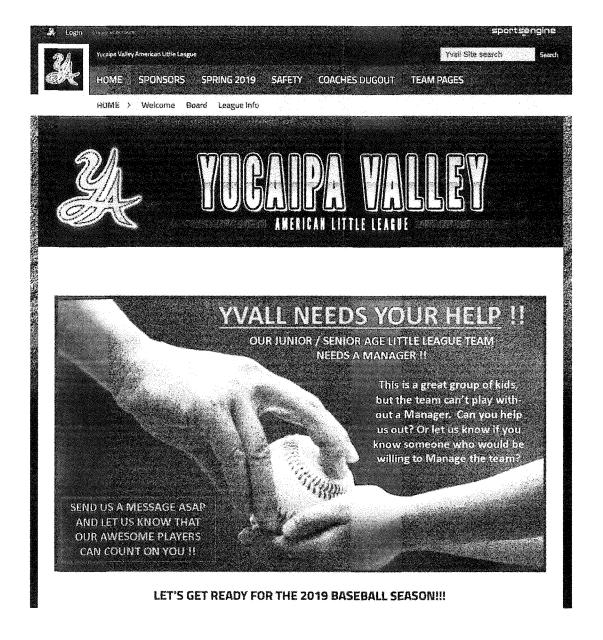

Visit the Brick Campaign website to order yours today!

CHI TURAL RESORBERS INVESTIGATION AND EVALUATION FOR THE CASS RESORDED THAN YEARSON SAN BERNARDING CREATING CASTANDESS

The Duniap Ranch, as Casa Blanca kanch was called in the late 19" and early 20" centuries, was the largest in Ydvaipa Valley, and was leadiquarters for (leaves ranching activities, which consisted mainly of raising cattle, goals, grain cross, and truit treus (Ydvaipa Valley Historical Society Musician red.ft). A small grape vineyand ecopied by yard west of the house. The residence was also the center of social activities for neighbors for nities around, and recoptions and particle was also the center of social activities for neighbors for nities around, and recoptions and particle was reven that there regularly (Chrograph 1896). Testers in d.). There was even an unsuccessful attempt to incorporate the ranch site as the lown in Dunlap (Ydvaipa Valley Historical Society 2007). In 1893 Pierce was appointed the arear's first postmaster, and the local past office was set up in a room next to the kilchen on the south side of the house, known loday as the filterry Mall sorvice at the Dunlap Ranch continued until 1896, with stage coaches travilling along Oak Glen Road stepping for pickups and delivens. (Yczalge-Calinesa Alexes Marce 1978). That year, postal service was moved across the road to larger quarters at Hayseed Hall in where it remained until 1910 (recalipa Valley Hasinica) Society Museum in difference in the property of the property o

Early in the houses history, the Dunlaps built an 8-by-10-ton; recommitted the shellor of the north-side porchi equipped it with a blackbuard, and began using it to conduct the first grammin school classes in the area (Humphreys 1978). The school room was also occasionally used to church services when clicult preachers happened to be pessing through. The room was used as a school unit around 1911, when the Pass School was connect on Cherrycroft Poad about half a mile north (Yucaipa Valley Historical Society Museum, n.d.q.).

A drought during the late 1890s and early 1900s, along with increasing taxation, brought about the end of the large cartie herds and the vast Dunlap Ranch. The Durians, who had owned and farmed most of Yucapa Valley, who referred to subdivide and self-ruch their property as smaller tarms (Archer 1976; Yucapa Valley Historical Society Museum in dip). In November 1906, Franklin Pierce and Isabelle Dunlap sold for ranch property, including their two-story pick house, to George, A. Atxond, one of the rounders of the ruceips Colonization Company (Consolidated Abstract and Title Guarantez Company 1906). The Dunlaps moved to Redlands, and later lived in Balto, where Pierce ded in 1924 and Isabelle plassed away in 1936. (San Bernardine County Sun 1928, Teeters in dip.).

In 1908, Itsis than two years after George Atwood had acquired the Dunlap Ranch and house through a land deal made by his Yucaipa Colonization Company, he and his wife, Alice, made a veciding gift of the Iwo-story brick residence and 257 surrounding across of termior Dunlap land to Their only sen. 21 year-old (seen A. Atwood, and his 20 year-old tride, Frances Hosper Atwood of Colton Between about 1910 and 1912, the younget Atwoods completed extensive modifications to the extensive modifications to the extensive the building. They increased the diversity with a secendatory perchitect, and extending the secendatory before by epilecing the former part with a secendatory perchitect, and extending the secendatory troof to snellte II. Along the front and north sides, the flat, jigsaw-out brackets that had decorated the tops of each of the original purching support columns were removed and reinstalled on the new accordatory roof supports. Plains square-section cross proces replaced the original hadcars on the downstans porch columns. The former central window opening in the front of the secondatory was cut all the way down to the new upper-poich floor, and the window was replaced white, and the Atwoods named their house. Casa Blanca: (harren 1996: Humphreys, 1978; heliner 1984; Yucaipa Valley Historical Society Museum n.d.d.f. n).

Homeseekers Attention

Land sales from February 8th, the opening day, to February 25, 1910, \$125,000 and interest and sales unabated. The people know a good thing when they see it.

Yuraipa Yalley

REDLANDS, CALIFORNIA

There is no better apple country than the Yucaipa Valley. Last year's apple crop equalled in dollars and cents, color and flavor, the crop of Oregon's famous Hood River District. Yucaipa apples are unexcelled by any others grown anywhere. Rediand's lame as an orange district will be equalled, if not excelled, by the Yucaipa Valley as a producer of prize apples.

Grapes, apricots and olives are big producers. In the Yucaipa, every fruit, vegetable and cereal that grows and produces in Southern California, linds the necessary essentials in Yucaipa Valley soil to bring it to perfection. Yucaipa's fertile acres are being soid at fair, honest prices, and the terms are most liberal. Big advances are certain to come. Buyers will reap large profits.

If you can, arrange to make a trip to the Yucaipa and see for yourself. Come to Rediands and we will gladly take you over the valley and prove to you every statement we make.

If you cannot come, write us for free illustrated literature.

Suveg Cellars brings the first winery to Yucaipa

Dec 28, 201

Suvez with his now dormant wheyard outside his Hidden Meadows home

"Wine makes people happy," said Craig Suveg, owner of Yucaipa's first bonded winery. "And sharing happiness is a good thing."

And Suveg is certainly happy to have his new business, Suveg Cellars, up and running, with his winery and tasting room open to the public on Jan. 1.

Suveg, the owner of Yucaipa Music and a federal prosecuting attorney, said he became interested in wine 15 years ago when he began reading about the health benefits of wine. "I developed my palette and thought I had a good idea of what I liked. Then I began to wonder if I could make it and began to research it," he said.

e jeden wat joby in die gewant.

The vineyards at Shadow Mountain are planted around 3,500 feet above sea level. The vines grow in rocky soil that has been infused with a balance of minerals and pH levels that need constant monitoring. The location and direction of each row has been carefully selected for optimal growth and protection from the elements. The environment is harsh and unforgiving; but in the right hands, it becomes ideal for growing the grapes that make award-winning with

Santa Barbara Highlands Vineyard

The Santo Barboro Highlands Vineyard is unlike any vinayard on California's Central Coast. Over 60 miles east of the Pacific Ocean, the property is in Region III, covering rolling hills and mountain plateaus at an elevation ranging from 2,800 to 3,200 feet above sea level. With approximately 3,300 to 3,500 degree days, such an altitude demands sensitive management of UV intensity, as the vines' exposure to sea rays is equal to a few hours' additional surlight at sea level—not ealite the length of days at the Washington/Oregon barder. Concentrated UV exposure is bulanced slightly by a 30 to 40-degree diamot swing, with elevation cooling the Highlands Vineyard's day temperatures by 10 to 15 degrees, despite its inland position and distance from the ocuan.

Curing a path through the property is the Cuyama River, which supplies most of the property's water, as Highlands receives only 5 to 12 inches at rainfall annually. (Six of those inches are provided

by snowmelt, which regularly recharges the river's supply.) This extreme artidity translates to excellent riponess on a regular basis, even in the most challunging of visitoges. Passive frost prevention from nearby hills opens cold air drains, moving cold air into the vineyard and out along the river; while active management comes from sprinklers in forwhying areas. Uniquely, the Santa Barbara Highlands Vineyard has little past pressure, allowing for minimal past contraising of forming.

The Cuyama River contributes beneficial bench lands and allevial soils to the wide array of soil types across the property, including everything from rocky sands to loanly clays. This broad spectrum of soils is highlighted in the wines: Lighter fextures ripen fruit faster, giving Jammy fruit flavors, while heavy clays mature fruit more slowly and show incre spice and earth characteristics.

The Santa Burbare Highlands Vinoyard comprises 747 cares of vines, whose fruit is predominantly sold to independent vinemakers. Varieties include:

Cabernet Franc

Caberner Souvignon

Grenuche

Granocha Blune

Malpe

Meriot Mourviidre

Oranga Mescar

Petite Siroh

Rouseanne

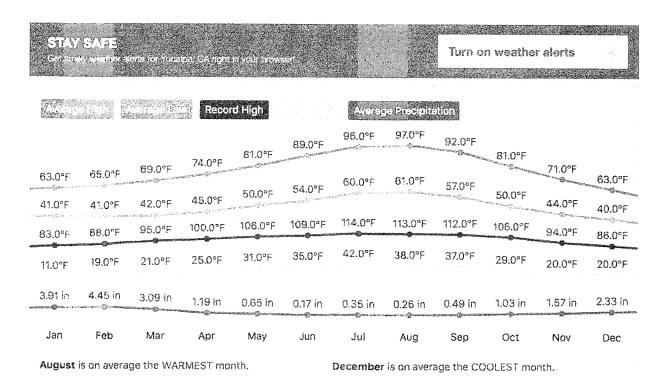

Sauvignen Blanc

Syrah

Viagnier

Anaheim Office Report # 18-284-0003 October 26, 2018

Kory Meyers 13530 Oak Mesa Dr. Yucaipa, CA 92399

WINE GRAPE SOIL

Attached are results of analysis carried out on the soil sample recently submitted. Syrah, Chardonnay, Cabernet Sauvignon wine grape are to be planted in this soil.

Based on the half saturation percentage the soil is estimated to be sandy loam in texture.

The pH is neutral which is favorable. No pH adjustment is required. There is a low level of lime which will keep the pH from decreasing and may reduce the availability of some of the minor elements.

Sallnity, sodium and boron all start out favorably low. Ultimately the soil salinity will be dependent on water quality and irrigation practices.

The soll has excellent levels of calcium and magnesium. Available soil nitrogen is ideal. Phosphorus, potassium and all of the minor elements are relatively low.

Grapes generally do not have high fertility requirements but in this soil phosphorus and potassium are low enough that they should be supplemented prior to planting. Broadcast 3.5 lbs. of triple superphosphate (0-45-0) and 3.5 lbs. of potassium sulfate (0-0-50) fertilizer per 100 ft. of trellis row. Spread the material uniformly in a row 5 feet wide that straddles the planting row. Incorporate the fertilizer to a 6 inch depth.

Grapes usually require very little nitrogen. If you plant this Fall do not apply any nitrogen until the Spring of 2019, in the first and second growing seasons apply about 20 pounds of actual nitrogen per acre. If the crop is drip irrigated the most efficient means of supplying the fertilizer is via the irrigation system. Urea which contains 46% nitrogen can be applied in the middle of an irrigation set at a rate of 20 lbs. per acre when the plants start actively growing in the late Winter/ early Spring. A follow-up application of urea at 20 lbs. per acre can be made 6-8 weeks later. Avoid late season

Leaf or petiole analysis is used to evaluate the nutritional status of established vineyards.

The likelihood of minor element deficiencies is low but if there is chlorosis of the youngest growth in the Spring and if it persists as the soil warms that a foliar application of zinc, manganese and iron will help.

Please let us know if we can be of additional assistance.

Factsheet

Flooded vineyard case studies

DPI Victoria

Fundamental management of flooded vineyards

Flooding across large areas of New South Wales and Victoria during March 2012 has resulted in flooded vineyards in several of the states' winegrape-growing regions. These case studies aim to inform growers of some immediate issues to consider and issues for next season based on others observations'.

Flooding may be caused by from heavy localised rains, flood waters slowly flowing across the landscape or a combination of both. Whotever the cause, the duration and timing of flooding are important to consider. Flooding of well-drained soil types, where water disappears in one or two days, usually has little impact on vine growth. Where flood water is slow to recade, either due to soil type or the volume of water, some issued may arise.

When soil becomes waterlagged, it becomes anaerobic as air is forced out from pores in the soil. Roots need air to function, and waterlagged roots will die over a period of time. However, flood events from 2011 have shown vines are resilient, and can return to production in the following season without significant side-effects. To minimise the impact of flood on vineyards, water should be encouraged to drain away, or pumped from the vineyard as soon as possible.

Observations from vineyards flooded in 2011 include:

- for the best outcome, drain or pump all surface water as soon as possible
- · increased vigour noted in the following season
- some reduced yield observed in the following season (variety-dependent)
- increased disease pressure in the following season (associated with higher rainfall and disease pressure in year of flood)

Considerations for the growing season following a flood:

- areas with poor soil drainage (impervious sub-soil) are most likely to have dead vines
- cold, wet soil may result in unthrifty vines early in the season (restricted spring growth)
- sudden vine collapse, resulting in vine defoliation, may occur in poorly drained areas
- high disease pressure during the flood may result in increased spore load and disease pressure in the following season. Improved spray programs, particularly around flowering, are important to minimise crop loss to disease
- · mare water shoots may grow on some varieties
- flower and berry set may be influenced resulting in lower yield
- increased soil water content may result in more vigorous vine growth later in the season, thereby reducing airflow in the canopy
- increased weed seed distribution and weed growth is common
- waterlagging and leaching may decrease sail nutrition; consider sail testing and nutrient applications.

NITROGENFRIEND OR FOE OF WINE QUALITY?

Surburn on Cabernet Souvignon berries; p common problem with overexposed grapes and axensive ninesees supply.

BY Marcus Keller, Wahington State University Prosser, WA

Yield is determined by the amount of carbohydrates (sugar) partitioned to the fruit rather than to other organs of grapevines. The classical view of the relationship between grape yield and quality is that of a linear decrease in quality as yield increases. Moreover, many grapegrowers believe that the more they stress their vines, the better the resulting fruit quality will be.

Why Limestone Matters for Wine Grape Growing

May 25 2510

It has long been recognized that great wine regions such as Champagne, Burgundy, Chablis, the Loire and southern Rhône valleys, and Saint-Emilion in Bordeaux are rich with limestone. Or, more precisely, these soils are rich in plant-accessible calcium carbonate, the principal chemical component of limestone, typically from decayed limestone outcroppings. (Limestone itself is too hard for plants' roots to penetrate.)

Limestone is rare in California except in a crescent of land in the Central Coast between the Santa Cruz Mountains to the north and Lompoc to the south. When we were searching for a site on which to plant our vineyard, finding calcium-rich soil similar to that of Château de Beaucastel was a primary criterion. That calcium-rich soils were only found in the Central Coast focused our search in this area. The west side of Paso Robles and Templeton is the state's largest exposed limestone layer, and in 1989 we bought our property here.

Winemaker and Vineyard Manager Neil Collins with a handful of broken calcarcous rock

For all the anecdotal evidence of the superior qualities of calcium-rich soils, the science behind how calcareous soil influences grapevine health and the wines that come from them is still being explored. It turns out that there are four principal reasons why these soils improve wine quality.
